## RESEARCH INTERESTS

My thesis is focused on past and future changes in global ocean circulation, with an emphasis on identifying the driving mechanisms and evaluating their detectability in observational records. Beyond my thesis work, I am broadly interested in all research that combine models and observations to advance our understanding of Earth's global and regional climate systems, particularly problems involving ocean dynamics, climate variability, and long-term climate change.

## RESEARCH EXPERIENCE

### Woods Hole Oceanographic Institution

*Advisor: Geoffrey Gebbie*

Sep 2021–Present  
Woods Hole, MA

- Explored causes of deep ocean cooling using MITgcm simulations, supporting NASA efforts of global ocean modeling and data assimilation.
- Analyzed 15TB+ of next-generation high-resolution coupled climate model output to understand the connections between ocean circulation and dissolved chemicals in the ocean.
- Produced written reports, posters and presentations to communicate findings to broader communities.

### Woods Hole Oceanographic Institution

*Advisor: Hyodae Seo*

Sep 2021–Sep 2023  
Woods Hole, MA

- Processed and analyzed 3TB+ of high-resolution climate data and found significant connections between near-shore sea surface temperature and extreme California precipitation events.
- Developed tools to analyze big climate data using Python and Julia.

### Los Alamos National Laboratory

*Advisor: Mark Petersen*

Jun 2021–Aug 2021  
Los Alamos, NM

- Implemented reduced-precision capabilities within the ocean component of the Energy Exascale Earth System Model.
- Found that reduced precision significantly reduced compute time but at cost of model skill.

### Institute for Pure and Applied Mathematics

*Advisor: Thomas Merkh*

Jun 2020–Sep 2020  
Los Angeles, CA

- Co-developed Q-learning and Deep Q-learning algorithms to improve satellite network communication efficiency for the Aerospace Corporation.
- Empirical models were built in Python primarily using PyTorch and NetworkX.
